RTL8111/8168/8411 PCI Express Gigabit Ethernet Controller (rev 09) Apt-get update ~# apt-get install dkms ~# wget  
Published inLinux.. I don't know, but I seriously put faith in this method as if it was like blowing on NES cartridges.. I can even  
restart and it will go to blue during boot, but will re-negotiate to a green (gigabit connection).

It wasn't working all along either because I tried everything for days, recompiling kernels, reinstalling driver modules, rebooting, reconnecting cables, and trying different ones.. This is going to sound weird, but I plugged the cable from one port on the switch back into another port of the same switch.. Therefor you have to install the latest driver Solution/Fixl Download and apply the latest driver.. After I gave up trying things in linux, I even booted into a Mini-Windows XP boot CD, and tried changing device properties.

The only thing I can think that can somewhat explain it is that someone in a forum recommended electrostatically discharging my equipment, but I don't even know how you would go about that. [Arise My Love Newsong](#)

NIC crashes seem to occur while transferring files above 100mbps however the problem sometimes occurs during lower transfer rates too.. Mii-tool only reports a max supported 100baseTx-FD Anyone have better results? EDIT: I have gigabit capability working now.. (My switch and cables work fine for 1Gb/s on other computers ) Eth-tool responds to commands better than the default module, but it still fails after trying to change speed.. Dec 6, 2016 - By default on Debian is used 8169 driver instead of 8168 (Realtek ethernet driver).. It's not like I tricked the router because I can power cycle that and it will still work.
